Nomenclature

Abbreviations

Abbreviation	Description
ATR	Autothermal reforming
GTL	Gas-to-liquids
PFR	Plug flow reactor
SBCR	Slurry bubble column reactor
WGS	Water-gas shift reaction

Latin Symbols

Symbol	Description	Unit
$H_{i,j}$	Henry constant of species i in j	Pa
RMSD	Root-mean-square deviation	depends
RSS	Residual sum of squares	depends
t	Time	S
T	Temperature	K
V	Volume	m^3
\dot{V}	Volumetric flow rate	m^3/s
x	Molar fraction in liquid phase	_
z	Axial reactor coordinate	m

Greek Symbols

Symbol	Description	Unit
η	Dynamic viscosity	Pas
ho	Density	${ m kg/m^3}$
$ au_{Rel}$	Residence time	_
ω_i	Weight fraction	_

Subscripts

Symbol	Description
0	Initial
i	Fraction, index, species
j	Index, species
L	Liquid
ref	Reference
S	Solid

Superscripts

Symbol	Description
j	Cell index

Dimensionless groups

Definition	Name
$Bo = \frac{vL}{D_{eff,i}}$	Bodenstein number
$d^* = d \left(\frac{\rho g \Delta \rho}{\eta^2} \right)^{1/3}$	Dimensionless particle diameter
$K_C = \frac{\rho \sigma^3}{g\eta^4}$	Modified Morton number
$Mo = \frac{g\eta^4 \Delta \rho}{\rho^2 \sigma^3}$	Morton number
$Re = \frac{\rho dv}{\eta}$	Reynolds number
$Sc = \frac{\eta}{\rho D_{i,j}}$	Schmidt number
$v_0^* = v_0 \left(\frac{\rho^2}{\eta g \Delta \rho}\right)^{1/3}$	Dimensionless velocity

1 Introduction

1.1 Samples

In this section, a number of short examples how to use the packages will be given.

1.1.1 Citations and References

Citations can be easily made by the \cite-command. At first, prepare your literature database in the literature.bib-file. Then simply use the cite-command and the bibtex-key to cite the desired original source. The bib-file can be either exported from literature managing software like Citavi or EndNote (consult your manual) or you directly use the bib-file for your literature database (in this case we recommend you to use JabRef for having a nice front-end instead of editing the text files).

References to other items (figures, tables, equations, sections, subsections and so on...) can either be made with \ref or \autoref. While for the first command you have to provide the type of item (like see Chapter 1), the \autoref-command takes care of using the right label (subsection 1.1.1). One last remark on references and citations: Use a non-breaking space between the element you refer on and the citation/reference. This can be achieved by using a tilde character (~) instead of a blank between the elements. Otherwise LATEX allowed to insert a line break between the both.

1.1.2 Figures

You can include any kind of graphics (tif,bmp, png,jpg,pdf,eps) in your thesis as a figure. Some small notes:

• Always try to use the CMYK color model whenever possible. When printing your thesis the printer will work with this color model. It will make a huge difference for the colors you used in your thesis between computer screen and printout!

- When using jpg's, make sure to export them in high quality mode. Otherwise you will experience a gray blur around your figures because of too strong compression.
- When using pngs keep in mind that png uses its own color model for display on a computer display. If you want to print your thesis, the colors will not be the same (CMYK color model on printers). This means, png is perfectly fine for gray-scale figures, but try to avoid it for colored ones.
- Vector graphics (pdf, eps) are best suited for rescaling them in LATEX. If you have to use raster-based formats (tif, bmp, png, jpg), make sure the resolution of the image is large enough and that you do not change the aspect ratio of the original image.

Figure 1.1 is a sample of how to embed a graphic file into your thesis. Try to place you figures always at the top or the bottom of a page. Never embed a figure, table or plot between paragraphs!

Figure 1.1: Sample figure (some kind of famous logo).

1.1.3 Tables

Table 1.1 gives an example of how to use tables. The caption has to be above the table. You can define different types of column alignment (l=left, c=center, r=right, S=for numbers). Please see the effect of the different types in the following table. The S-column is a special column provided by the siunitx package for typesetting numbers in tables. These are aligned on the decimal point rather than the total length of the number. This is especially useful if you encouter different number of significant digits. Text in an S-column has to be wrapped in curly brackets ({}).

One word about constructing a table: Try to avoid vertical lines whenever possible, they often interrupt the normal reading flow from left to right. The booktabs-package provides you with thicker lines for the first and last lines of a table (\toprule and \bottomrule). Have a look at the example.

1.1.4 siunitx

The package siunitx helps you to typeset SI-units correctly. Please always keep in mind, that while symbols are always in itallic font, units are typesetted in normal font (see http://physics.nist.gov/cuu/pdf/checklist.pdf) It can either by used in normal text to give quantities, for example 1.3 kg/m³, or just units, like µN/m². Please refer to the documentation for further options and possibilities (http://ctan.mackichan.com/macros/latex/contrib/siunitx/siunitx.pdf). siunitx can also be used in math mode:

Example 1:
$$c_p(Water) = 4.2 \frac{J}{\text{kg K}}$$

Example 2:

$$P_{el} = 3 \,\text{MW} \tag{1.1}$$

Table 1.1: Table for testing.

Header	Center	New Column	$ ho { m inkg/m^3}$
Row 1	Cell 2	2.5553	2.5553
Row 2	123	235.2	235.2
	First was empty	ABC	TEXT

When giving equations, either use quantity equations, that are independent of the measurement unit, like

$$Re = \frac{\rho \cdot d \cdot u}{\eta},\tag{1.2}$$

where the units of both sides of the equation are equal (in this case dimensionless), or use numerical value equations:

$$\frac{\dot{V}}{\left\lceil \frac{\mathbf{L}}{\mathbf{s}} \right\rceil} = -1 + 2.247 \cdot \exp\left(0.04266 \cdot \frac{h}{\left[\%\right]}\right) \tag{1.3}$$

Here, you explicitly have to give all units of the involved numerical quantities. This means, the equation is only valid for the given set of units (e.g. useful for fitted equations without physical background) and the user of the equation has to take care of doing the unit conversion before using the equation. Never give the units needed for such an equation in the text, always clearly state them in the equation itself. Further information can be found in the ISO 80000-1 [1].

1.1.5 Plotting

TIKZ and pgfplots can be used to do plotting inside LATEX. In the following some samples of how to plot data are given. If you need any special functionality, always check both documentations first (ftp://ftp.mpi-sb.mpg.de/pub/tex/mirror/ftp.dante.de/pub/tex/graphics/pgf/base/doc/pgfmanual.pdf and http://pgfplots.sourceforge.net/pgfplots.pdf).

pgfplots can be used to plot data from equations provided, like the polynomials in Figure 1.2. Other examples are subplots (see Figure 1.3, where you can refer to one subfigure as well Figure 1.3a) or the plotting from an external csv-file (Figure 1.4).

Always try to make your plots as simple and distinct as possible. Do not use the same type of line for all data series. When employing colors (try to avoid them when possible), make sure the plot can be copied in grayscale mode so that the elements are still clearly distinguishable. If different line types are not enough and you have to use colors, it may be better to distribute the data to two separate graphs.

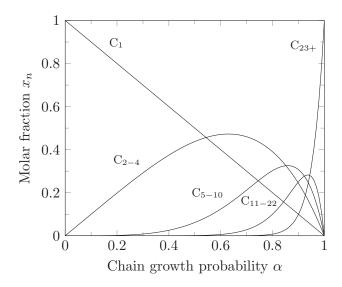

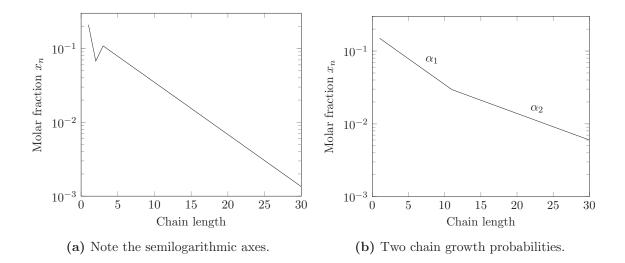

Figure 1.2: ASF hydrocarbon product distribution. Sample plot of how to use polynomials for plotting data.

 ${\bf Figure~1.3:~Sample~of~how~to~use~subfigures.}$

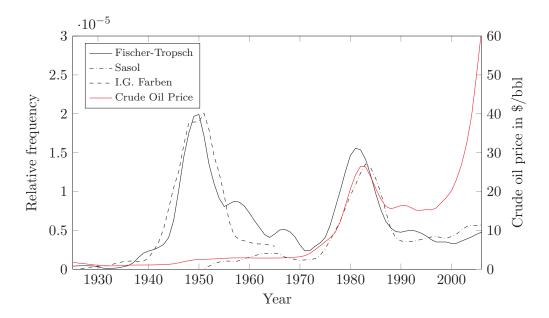

Figure 1.4: Long title. Sample plot for showing how to plot data from a csv-File on two y-Axis and a lot of customization

1.1.6 Final Note

If you encounter some problems during writing your thesis with LATEX (and you will!), it is always a good idea to comment out specific parts and try to recompile your document. Step-by-step you will find out what the error is (most often: missing brackets).

A good source for information on how to use the packages, how to modify the options and which additional functionality is provided are the official documentations of the corresponding packages. Most often they are well written with numerous copy-and-paste samples.

http://tex.stackexchange.com/ is a very good source for finding relevant information concerning error messages, problems while typesetting your document and examples. If you do not know any further with your problem, try to assemble a minimal working example (MWE) and post it there. The people there are very friendly and have a lot of expertise with LATEX, which they are happy to share. Never try to post a full document or without code, as the people there will not be able or willing to help you.

Declaration

The submitted thesis was supervised by Prof. Dr.-Ing. Birgit Vogel-Heuser.

Affirmation

Hereby, I affirm that I am the sole author of this thesis. To the best of my knowledge, I affirm that this thesis does not infringe upon anyone's copyright nor violate any proprietary rights. I affirm that any ideas, techniques, quotations, or any other material, are in accordance with standard referencing practices.

Moreover, I affirm that, so far, the thesis is not forwarded to a third party nor is it published. I obeyed all study regulations of the Technical University of Munich.

Remarks about the internet

Throughout the work, the internet was used for research and verification. Many of the keywords provided herein, references and other information can be verified on the internet. However, no sources are given, because all statements made in this work are fully covered by the cited literature sources.
